

Maximize your application power, with Integrys managed platforms

Combining technology and service solutions to make your job easier

Integrys is committed to finding and bringing you the newest, most advanced technologies, and verified applications. With 50 years of experience, we are leading the way in engineered solutions that work for telecommunication providers and systems manufacturers in Canada.

Integrys is the industry leader in selecting and evaluating new embedded, high availability computer and imaging technology for communications applications. The Integrys “seal of approval” is your assurance of proven value.

A voicemail-PBX manufacturer has significant software challenges. They need to add the features demanded by a tech-savvy market. New technologies such as Voice Over IP can stress existing architectures. What they don't have time for is managing their host computing systems through component obsolescence, industry certifications, and future-proofing.

That's where Integrys shines.

Recently, Integrys developed the hardware architecture while our OEM customer focused on their industry knowledge and software development. Integrys integrated proprietary I/O cards into our platforms, loaded and tested software and hardware. The full turnkey logistics support included packaging, shipped to the end customer, and providing post-implementation support. Our OEM client was able to meet their end customers requirements on time, on budget and without technical issues.

Integrys designs future-proofed platforms which allow your applications to shine. Need NEBS certification from board to server level? Integrys can manage this for you. Implementation and design support ensure exceeding performance and longevity parameters. Supply chain management means staying current with new technologies, while minimizing update disruptions. This is why Canadian telecom innovators rely on Integrys to provide their pre-certified application servers.

INTEGRYS

Connecting Technology & Innovation

Client computers shouldn't get in the way of getting more powerful products to market rapidly

Integrys offers a wide range of services for telecom applications:

Solution Implementation

- Integration with existing proprietary systems
- High-level technology road mapping
- Compliant testing and validation
- Implementation support
- Post-application support

Engineering Support

- On-site support
- COTS replacement components
- Custom engineering
- System integration

Service Support

- Guaranteed replacement
- Regular maintenance

Documentation Support

- Certification services
- ISO compliant documentation
- Version control

Supply Chain Support

- Inventory/supply chain management
- Vendor management

A software company needs to focus on their applications —not managing compatibility issues due to variances in the many computers and I/O chipsets their end customers use. A telecom software company specializing in voicemail storage and VOIP routing approached Integrys to help solve these hardware conflicts. The same software, I/O boards and configuration wouldn't always work the same way on different customer servers. It was counter-productive to focus technical resources on resolving the constant conflicts. Especially when clients needed support for ensuring other applications worked on the supplied platform.

Enter Integrys.

Integrys collects requirements for the shared computer from both the telecom software manufacturer, and the end-users. We design a managed platform complete with enabling I/O technology, which not only meets both requirements but ensures long term compatibility, through long life cycle and strong revision control policies. Integrys delivers the computer pre-loaded and fully tested with all application software.

With life-cycle planning and supply chain management to pre-certified servers, our client is able to focus on powerful applications which leverage current architecture, and meet the demands of knowledgeable telecom customers.
